

**In the Specification**

Please amend the abstract in the above-identified application as follows:

5       An ~~improved structure of~~ audio signal cable, the features  
of which are that the audio signal cable has ~~is comprised of~~  
arrayed solid and tinsel wire conductors. After each of the  
conductors are insulated and bundled, they are placed into a  
surrounding insulation. The solid conductors are of a circular  
10 and a flat, thin shape. The solid conductors are of differing  
larger and smaller diameters and, furthermore, disposed in  
unequal quantities. ~~The smaller diameter tinsel wires are~~  
~~twisted to increase distance and enlarge their surface area to~~  
~~reduce skin effect for better high frequency transmission, while~~  
15 ~~the larger diameter conductors enable the rapid conveyance of~~  
~~low frequencies. As such, the present invention achieves the~~  
~~synchronous phasing of high and low frequency signals.~~
